These observations ask for a reflection on the absoluteness of notions in model theory: for example, can we make two models isomorphic if they were not before? Can we change the fact that some kind of “nice” model exist? Saturated, universal ...

Here are some words on this from Gerald Sacks, the inventor of Sacks forcing (in 1971), from his book “Saturated Model Theory” in 1972.

model theory bears a disheartening resemblance to set theory, a fascinating branch of mathematics with little to say about fundamental logical questions, and in particular to the arithmetic of cardinals and ordinals. But the resemblance is more of manners than of ideas, because the central notions of model theory are absolute, and absoluteness, unlike cardinality, is a logical concept. That is why model theory does not founder on that rock of undecidability, the generalized continuum hypothesis, and why the Łos conjecture is decidable: A theory  $T$  is  $\kappa$ -categorical if all models of  $T$  of cardinality  $\kappa$  are isomorphic. Łos conjecture was what is now known as Morley's theorem:

Absolute notions in model theory

Mirna Džamonja

Introduction

In model theory

Syntactic and semantic notions

Absoluteness from model theory in set theory

(Non)-absoluteness from set theory in model theory

Łos conjecture was what is now known as Morley's theorem:

### Theorem (Morley 1965)

*A (countable complete first order) theory  $T$  is categorical in some uncountable power iff it is categorical in every uncountable power.*

Łos conjecture was what is now known as Morley's theorem:

### Theorem (Morley 1965)

*A (countable complete first order) theory  $T$  is categorical in some uncountable power iff it is categorical in every uncountable power.*

It follows immediately that being uncountably categorical cannot be changed by set forcing, since for such a forcing there will be a cardinal  $\kappa$  such that  $V$  and  $V[G]$  agree on all statements about object of size  $> \kappa$ .

Łos conjecture was what is now known as Morley's theorem:

### Theorem (Morley 1965)

*A (countable complete first order) theory  $T$  is categorical in some uncountable power iff it is categorical in every uncountable power.*

It follows immediately that being uncountably categorical cannot be changed by set forcing, since for such a forcing there will be a cardinal  $\kappa$  such that  $V$  and  $V[G]$  agree on all statements about object of size  $> \kappa$ .

To prove this theorem Morley introduced the idea of a *rank*, which is a measurable, absolute way to handle the formulas of a theory, and it is really because of ranks that categoricity is absolute, as we proceed to explain.

# Semantic versus Syntactic

Morley's theorem and subsequent huge amount of work by Shelah in his "Classification theory" is based upon a philosophy of connecting semantic notions with syntactic ones.

On the next slide we shall see a typical example of a syntactic notion defined using a saturated model.

# Saturated models

A model of a theory  $T$  is said to be  $\kappa$ -saturated if it realizes all (consistent) types of  $T$  of size  $< \kappa$ . It is easy to see that  $\kappa$ -saturated models are unique up to the cardinality (The Uniqueness Theorem) and using the compactness theorem, we can prove that for every  $\lambda$  with  $\lambda = \lambda^{<\kappa}$  there is a  $\kappa$ -saturated model.

On the next slide we shall see a typical example of a syntactic notion defined using a saturated model.

Because the properties like this one do not depend on the choice of the sufficiently saturated model, we work with any fixed such model, which we denote by  $\mathfrak{C}_T$  (monster model).

## Definition

$T$  has SOP<sub>2</sub> if there is a formula  $\varphi(\bar{x}, \bar{y})$  which exemplifies this property in  $\mathfrak{C} = \mathfrak{C}_T$ , which means:

There are  $\bar{a}_\eta \in \mathfrak{C}$  for  $\eta \in {}^\omega 2$  such that

- (a) for every  $\rho \in {}^\omega 2$ , the set  $\{\varphi(\bar{x}, \bar{a}_{\rho \upharpoonright n}) : n < \omega\}$  is consistent,
- (b) if  $\eta, \nu \in {}^\omega 2$  are incomparable,  $\{\varphi(\bar{x}, \bar{a}_\eta), \varphi(\bar{x}, \bar{a}_\nu)\}$  is inconsistent.

## Definition

$T$  has SOP<sub>2</sub> if there is a formula  $\varphi(\bar{x}, \bar{y})$  which exemplifies this property in  $\mathfrak{C} = \mathfrak{C}_T$ , which means:

There are  $\bar{a}_\eta \in \mathfrak{C}$  for  $\eta \in {}^\omega 2$  such that

- (a) for every  $\rho \in {}^\omega 2$ , the set  $\{\varphi(\bar{x}, \bar{a}_{\rho \upharpoonright n}) : n < \omega\}$  is consistent,
- (b) if  $\eta, \nu \in {}^\omega 2$  are incomparable,  $\{\varphi(\bar{x}, \bar{a}_\eta), \varphi(\bar{x}, \bar{a}_\nu)\}$  is inconsistent.

Properties like this one (but not yet this one) have been shown to be equivalent to semantic notions, through the work in classification theory.

## Definition

$T$  has SOP<sub>2</sub> if there is a formula  $\varphi(\bar{x}, \bar{y})$  which exemplifies this property in  $\mathfrak{C} = \mathfrak{C}_T$ , which means:

There are  $\bar{a}_\eta \in \mathfrak{C}$  for  $\eta \in \omega^{>2}$  such that

- (a) for every  $\rho \in \omega^2$ , the set  $\{\varphi(\bar{x}, \bar{a}_{\rho \upharpoonright n}) : n < \omega\}$  is consistent,
- (b) if  $\eta, \nu \in \omega^{>2}$  are incomparable,  $\{\varphi(\bar{x}, \bar{a}_\eta), \varphi(\bar{x}, \bar{a}_\nu)\}$  is inconsistent.

Properties like this one (but not yet this one) have been shown to be equivalent to semantic notions, through the work in classification theory. For example, order properties, even as weak as this one, imply the maximal possible number of non-isomorphic models at large enough cardinals.

## Definition

This order was introduced in the 1960s by Keisler and was later used by him and Shelah to complement the classification theory offered by stability. Keisler proved that having the strict order property implies that a theory is maximal in this order.

## Definition

(1) For any cardinal  $\lambda$ , the Keisler order  $\triangleleft_\lambda$  among theories is defined as follows:

$T_0 \triangleleft_\lambda T_1$  if whenever  $M_i$  is a model of  $T_i$  ( $i < 2$ ) and  $\mathcal{D}$  is a regular ultrafilter over  $\lambda$  then the  $\lambda^+$ -saturation of  $M_1^\lambda/\mathcal{D}$  implies the  $\lambda^+$ -saturation of  $M_0^\lambda/\mathcal{D}$ .

(2) We say  $T_0 \triangleleft T_1$  if for all  $\lambda$  we have  $T_0 \triangleleft_\lambda T_1$ .

This order was introduced in the 1960s by Keisler and was later used by him and Shelah to complement the classification theory offered by stability. Keisler proved that having the strict order property implies that a theory is maximal in this order.

Note that this is semantic notion and there is no *a priori* reason why it should be absolute.

In a paper continuing a long list of work and in which they used a completely original idea, Malliaris and Shelah (2013) showed that being  $SOP_2$  suffices for maximality in Keisler's order!

In the same paper and using the same circle of ideas, Malliaris and Shelah solved a seemingly unrelated problem, posed by Hausdorff in 1936: the equality between two cardinal invariants of the continuum, namely  $\mathfrak{p} = \mathfrak{t}$ .

Although it is not necessary for us to have a definition of these invariants, the remarkable thing is that they are two out of at least 50 invariants known, each other pair having been shown independent by the method of forcing in the 1980s or so!

In a paper continuing a long list of work and in which they used a completely original idea, Malliaris and Shelah (2013) showed that being  $\text{SOP}_2$  suffices for maximality in Keisler's order!

In the same paper and using the same circle of ideas, Malliaris and Shelah solved a seemingly unrelated problem, posed by Hausdorff in 1936: the equality between two cardinal invariants of the continuum, namely  $\mathfrak{p} = \mathfrak{t}$ .

Although it is not necessary for us to have a definition of these invariants, the remarkable thing is that they are two out of at least 50 invariants known, each other pair having been shown independent by the method of forcing in the 1980s or so! This one was an unsolved puzzle and we now know why.

In a paper continuing a long list of work and in which they used a completely original idea, Malliaris and Shelah (2013) showed that being  $SOP_2$  suffices for maximality in Keisler's order!

In the same paper and using the same circle of ideas, Malliaris and Shelah solved a seemingly unrelated problem, posed by Hausdorff in 1936: the equality between two cardinal invariants of the continuum, namely  $p = t$ .

Although it is not necessary for us to have a definition of these invariants, the remarkable thing is that they are two out of at least 50 invariants known, each other pair having been shown independent by the method of forcing in the 1980s or so! This one was an unsolved puzzle and we now know why.  $p = t$  is **absolute** because it is connected to  $SOP_2$ , which is absolute.

The theorem is then:

## Theorem (Dž.-Shelah + Shelah-Usvyatsov)

*If a theory  $T$  is  $\triangleleft^*$ -maximal in some model of GCH, then it has  $SOP_2$ .*

The theorem is then:

## Theorem (Dž.-Shelah + Shelah-Usvyatsov)

*If a theory  $T$  is  $\triangleleft^*$ -maximal in some model of GCH, then it has  $SOP_2$ .*

This leaves open a (relatively minor) question of the connection between  $\triangleleft$  and  $\triangleleft^*$ -maximality (all indications are that they are the same, see a recent paper by Malliaris and Shelah) and

The theorem is then:

## Theorem (Dž.-Shelah + Shelah-Usvyatsov)

*If a theory  $T$  is  $\triangleleft^*$ -maximal in some model of GCH, then it has  $SOP_2$ .*

This leaves open a (relatively minor) question of the connection between  $\triangleleft$  and  $\triangleleft^*$ -maximality (all indications are that they are the same, see a recent paper by Malliaris and Shelah) and a major question: is GCH necessary?

The theorem is then:

## Theorem (Dž.-Shelah + Shelah-Usvyatsov)

*If a theory  $T$  is  $\triangleleft^*$ -maximal in some model of GCH, then it has  $SOP_2$ .*

This leaves open a (relatively minor) question of the connection between  $\triangleleft$  and  $\triangleleft^*$ -maximality (all indications are that they are the same, see a recent paper by Malliaris and Shelah) and a major question: is GCH necessary?

If we prove set theoretically that GCH was not necessary, then we will have a confirmation of it model-theoretically as  $SOP_2$  is absolute, and vice versa.

Could it be because the answer is not absolute?

Association: Borel conjecture “every strong measure 0 set in  $\mathbb{R}$  is countable” is not absolute.

**Question** Is the answer to Zilber’s weak quasi-minimality conjecture absolute?

**Work in progress** By a technique similar to the one by Larson, I believe that yes. This uses Zilber’s axioms.

# Independence on the monster model

Suppose that  $T$  is a complete countable f.o. theory with a unary predicate and functions defining a group  $G$  in the saturated model  $\mathfrak{C}$  of  $T$ .

### Theorem

*(Krupiński, Newelski and Simon 2017) Let  $X$  be any  $\emptyset$ -definable subset of a product of sorts. Then the Ellis group of the  $\text{Aut}(\mathfrak{C})$ -flow  $S_X(\mathfrak{C})$  is of bounded size and does not depend on the choice of  $\mathfrak{C}$ .*
